Präambel

Die weltweit gestiegenen politischen und gesellschaftlichen Anforderungen bezüglich Lösungen zur Wasserversorgung und umweltbezogenen Investitionen im Wasserbereich steigern den Bedarf an gut qualifizierten, international orientierten Ingenieurinnen und Ingenieuren in diesem Bereich. Die Thematik des Studiengangs WAREM (Water Resources Engineering and Management) an der Universität Stuttgart zielt auf die Vermeidung und Lösung von Problemen und Fragestellungen in der wasserwirtschaftlichen Planung und im Wassermanagement. Aufgrund dieser Zielrichtung beziehen sich Lehrinhalte und Lernziele auch auf internationale Tätigkeiten, da z. B. Fragestellungen wie Bewässerungstechniken, die Auslegung großer Stauanlagen oder auch die Bereitstellung von guter Trinkwasserqualität besonders im internationalen Kontext von Bedeutung sind. Das Studium bei WAREM wird als konsekutiver Studiengang angeboten. Absolventen eines Bachelorstudiums können bei WAREM nach einem viersemestrigen Studium den Abschluss „Master of Science“ erhalten. Die im Studiengang WAREM ausgebildeten Ingenieurinnen und Ingenieure erwerben alle für die Universität Stuttgart wichtigen Kompetenzen und Kenntnisse, die als Grundlage für ein erfolgreiches Berufsleben dienen. Sie

- haben vertiefte Kenntnisse über Wasserwirtschaft, Wasserbau, Grundwasser, Geohydrologie, Siedlungswasserwirtschaft, Wasserqualität und verstehen die dabei grundlegenden natur- und ingenieurwissenschaftlichen Zusammenhänge,
- kennen die Methoden zur Entwicklung von wasserwirtschaftlichen Managementkonzepten, haben aber auch gleichzeitig die Fähigkeiten, diese zu planen und durch geeignete technische Maßnahmen und Installationen umzusetzen,
- können die Probleme durch und im Umgang mit Wasser- und Wassersystemen vorhersehen, erkennen und bewerten, sowie analytische, modellhafte und experimentelle Untersuchungen planen und durchführen,
- verfügen über die ingenieurwissenschaftliche Fertigkeit zur Entwicklung, zur Planung und zum Betrieb von Anlagen und kennen dabei auch die nicht-technischen Auswirkungen ihrer Tätigkeit,
- verfügen über die Kompetenzen zur organisatorischen und verwaltungsmäßigen Umsetzung der Wassermanagementaufgaben
- können Aufgaben mit interdisziplinärem und internationalem Charakter vor dem Hintergrund kultureller, wirtschaftlicher und politischer Rahmenbedingungen im Team bearbeiten,
- verfügen über eine hohe wissenschaftliche Qualifikation.

100 Vertiefungsmodule

Zugeordnete Module:	110	Vertiefungsmodule Pflicht
	120	Vertiefungsmodule Wahlpflicht

110 Vertiefungsmodule Pflicht

Zugeordnete Module: 19120 Sanitary Engineering
 50090 Environmental Fluid Mechanics I
 50620 Hydraulic Structures
 72750 Requirements of Professional Life and Engineering in Practise

Modul: 19120 Sanitary Engineering

2. Modulkürzel:	021220012	5. Moduldauer:	Einsemestrig
3. Leistungspunkte:	6 LP	6. Turnus:	Wintersemester
4. SWS:	4	7. Sprache:	Englisch

11. Empfohlene Voraussetzungen:

12. Lernziele:

The students have detailed knowledge about waste avoidance procedures in household and industry. Waste avoidance includes the ecology - oriented daily shopping, the substitution of contaminated materials in the industrial production as well as the Zero Emission Society. In the case of unavoidable waste fractions, the students acquire the competence to establish collection and transportation systems for these wastes, within the logistic, economic and legal frame. Main emphasis is given to the collection of recyclables. The students know the relevant factors which influence the waste amount and waste composition in general and in particular within the separate collection of recyclables. The students are acquainted with the state of the art of recycling technologies for separate collected paper, glass, metal and plastic including the pretreatment process. They have knowledge of the aerobic and anaerobic treatment and utilization of separate collected biowaste. Not avoided and recycled waste has to be treated before disposing off e.g. in a landfill site. The students possess a general knowledge of the mechanical and biological treatment technology as well as of the thermal waste treatment. They are able to evaluate the different treatment and recycling processes from an ecological and economic point of view. The students have knowledge about the most important components of the urban drainage and the

basic treatment processes of wastewater. Thus they are able to compare different systems in dependence of changing boundary conditions and assess the effectiveness and pros and cons of the systems, e.g. concerning impacts on the environment, economical and operational aspects. They obtain an understanding for system connections between the urban drainage system and the wastewater treatment system as well as between the urban water system and the environment.

13. Inhalt:	<p>Solid Waste Management: Waste generation and waste composition National and international regulations for waste Waste avoidance Collection and transport of waste Separate collection of recyclables Sorting of recyclables Recycling technologies for paper, glass, metal, plastic Biological treatment of waste Waste Disposal Ecological indicator systems Waste Water Technology: Basics of urban drainage and municipal wastewater treatment Quantity and Composition of Wastewater Urban drainage systems stormwater treatment mechanical wastewater treatment biological wastewater treatment sludge treatment natural close and ECOSAN systems</p>

12. Lernziele:

Students have fundamental knowledge of flow in various natural hydrosystems and its application in civil and environmental engineering.

13. Inhalt:

The lecture deals with flow in natural hydrosystems with particular emphasis on groundwater / seepage flow and on flow in surface water / open channels. Groundwater hydraulics includes flow in confined, semi-confined and unconfined groundwater aquifers, wells, pumping tests and other hydraulic investigation methods for exploring groundwater aquifers. In addition, questions concerning regional groundwater management (z.B. recharge, unsaturated zone, saltwater intrusion) are discussed. Using the example of groundwater flow, fundamentals of CFD (Computational Fluid Dynamics) are explained, particularly the numerical discretisation techniques finite volume and finite difference. The hydraulics of surface water deals with shallow water equations / Saint Venant equations, unstationary channel flow, turbulence und layered systems. Calculation methods such as the methods of characteristics are explained. The contents are:

- Potential flow and groundwater flow
- Computational Fluid Dynamics
- Shallow water equations for surface water
- Charakteristikenmethode
- Examples from civil and environmental engineering

11. Empfohlene Voraussetzungen:

12. Lernziele:

Advanced Studies in Hydraulic Structures: The students,

- Know about the basic features of hydraulic structures
- have an overview what are the main components and know how to arrange them in order to ensure a satisfying operation
- are able to dimension all parts of different hydraulic structures
- are aware of implicating river works into an overall context of a fluvial system and know how to act and to evaluate in spatial and temporal interrelation
- are able to realize the economic and ecologic significance of hydraulic structures as dams, reservoirs and hydro power plants

Case Study in Hydraulic Structures : The students,

- are able to use of the gained theoretical knowledge with the help of a practical example

- are aware of the technical relations and their effects on non-technical areas of interest
- can give a well-founded argumentation of chosen estimations and are able to present their own results
- can give a convincing presentation
- are able to assess objectively different planning alternatives

13. Inhalt:

Advanced Studies in Hydraulic Structures : The course deals with main structural components of hydraulic engineering schemes such as weirs, dams, hydro power plants, pipelines and ancillary works. The main features as hydraulic and structural dimensioning are treated. The application of structural power plants, reservoirs and river development works is discussed. Conventional engineering methods as well as approaches with improved environmental compatibility are taken into consideration.

Case Study in Hydraulic Structures : The case study uses the content of the lecture "Advanced Studies in Hydraulic Structures". In working groups of 3 to five students a real hydraulic structures will be planned and completely dimensioned. There are hydraulic calculations to be carried out as hydraulic capacity of spillway, dimensioning of stilling basin, hydrological and sedimentological calculations. As well the stabilities of the structures itself has to be checked. Additionally an analysis of the demand of potentially provided electricity, drinking water or irrigation water, resp. is required. The intermediate results will be presented by the groups. Every student has to deliver at least one presentation. Finally a poster for the final presentation and assessment has to be designed. This is the basis for the development of the assessment criteria for the different alternatives.

14. Literatur:

Lecture notes can be downloaded from the internet. Additional detailed information for the case study will be provided during the lectures.

12. Lernziele:	<p>River Engineering and Sediment Management The students,</p> <ul style="list-style-type: none"> • are aware of rivers must be regarded and managed based on an integrated approach • know the basic concept of the European Water Framework Directive (WFD) and the German legal framework for river basin management • are able to analyze and estimate the consequences of the WFD based inventory for future management • are aware of sediment transport processes and of the complexity of the interactions and relations • recognize the possibilities and limitations of sediment managements strategies
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Integrated Flood Protection Measures

The students,

- are aware of the fact that flood protection is an integral process, based on different components (e.g. technical flood protection measures, prevention)
- know the basic physical processes: dynamics of flood events, calculation of discharges and water depths, flood wave propagation, functionality of retention and protection structures: reservoirs, dams and dikes
- know 1-D and 2-D numerical hydro-dynamic models
- are able to apply their knowledge on practical engineering problems related to flood protection

13. Inhalt:	<p>The module consists of two lectures:</p> <p>River Engineering and Sediment Management</p> <ul style="list-style-type: none"> • Basic approaches of river basin management (legal framework) • Systematics and results of basic inventory due to the WFD • Anthropogenic impacts on river basins • Origin of sediments and fundamental principles of transport • Sediment management measures on different scales <p>Integrated Flood Protection Measures</p> <ul style="list-style-type: none"> • Socio-economic aspects of flood damage • Calculation of water depths • Hydro-dynamic flood wave calculation, Saint Venant-equation • Technical flood protection measures • Design and operation of retention basins • Set-up of damage and risk maps, design of overtopping earthen dams and dikes • Probability of failure, reliability calculation, flood risk management

12. Lernziele:	<p>Power Demand, Supply and Distribution:</p> <p>The students,</p> <ul style="list-style-type: none"> • know the German, European and worldwide energy markets related to demand, supply and its distribution capabilities • are aware of that non-renewable energy sources are strictly limited and time-scales for conversion of energy markets long • have an idea about the relations between energy, politics, social changes and influences on environment • have a basic knowledge about present energy conversion systems, theoretical limits of efficiencies, and the potential to enhance applied technology • have a basic understanding about where and how energy is provided and distributed • comprehend the balance between load and supply in electrical grids and the resulting necessity for control energy.
----------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Water Demand, Supply and Distribution:

The students,

- know the German and worldwide water systems related to demand, supply and its distribution capabilities
- have an overview on the water supply situation all over the world.
- recognize the different possibilities and levels of water supply
- have an idea of the relations between water, politics, social changes and influences on environment.

13. Inhalt:

Power Demand, Supply and Distribution:

- Energy demand, energy supply
- Energy generation
 - overview of different types of power plants
 - renewable energy
 - thermal power plants (conventional and nuclear)
- Areas of application of different power plants
- Emission control techniques
- Cooling of thermal power plants
 - methods
 - water resources aspects
- Energy transport and energy storage
- Net techniques
- Energy market
 - trade
 - politics
 - law
- social changes due to energy supply

Water Demand, Supply and Distribution:

- Water supply and water distribution: necessity, basic requirements, elements, hydrological cycle
- Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods
- Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas
- Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems.
- Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters
- Water storage: necessity, types and functions of tanks and reservoirs
- Case study: planning and design of a water supply system for a small town

11. Empfohlene Voraussetzungen:

12. Lernziele:

Lecture: Inorganic chemistry

The students

- know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
- know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
- know about the most important industrial compounds, their preparation and environmental aspects in their application.

Lecture: Organic chemistry

The students

- can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the common rules for their nomenclature
- know the most important representatives thereof and are able to draw their structural formulae
- know the structure and properties of important bio-molecules such as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic acids
- know the most important reactions involved in chemical and microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general function with respect to cell structures, enzymatic and immune reactions
- knows selected environmental organic contaminants (PAH, dioxins, pesticides etc.) and their properties

Lecture: Biology and ecology of water, soil and air systems

The students

- know about the relation between water, soil and air compartments and many diseases, happening especially in developing countries
- know about the reasons for break out of diseases, the structure and function of prokaryotic and eucaryotic cells as well as the methods for identification and determination of growth conditions and possible growth limitations
- comprehend microbial metabolism, energy production, release and conservation, enzyme syntheses and their regulation.

- know important events and scientists in the history of biology
- know basics in ecology of natural and artificial ('technical') ecosystems as well as selected methods to detect distorted equilibria in technical ecosystems influenced by mankind

Lecture: Technical and medical microbiology for engineers

The students

- know the most important microorganisms being active in plants treating waste water, air and contaminated soil
- know the kind of participation in purification and thus the procedures used to make them feel happy as well as the problems associated with excess biomass
- are aware of a detailed overview of the kind of medically important microorganisms and of the most relevant agents of illness met in these plants, this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

Lecture: Inorganic chemistry

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms
- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
- chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
- quantitative Relationships and Stoichiometric Equations
- characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
- descriptive part: selected chemical compounds and their preparation and properties

Lecture: Organic chemistry

- functional groups and compound classes
- classification of chemical reactions in organic chemistry
- organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
- chemical and microbial degradation of organic matter in the environment
- summary parameters
- organic environmental contaminants

Lecture: Biology and ecology of water, soil and air systems

The following topics are presented within the lecture:

- Introduction in history of microbiology

- Important waterbased/water related diseases
- Function of microscopy of staining techniques
- Structure and function of prokaryotic cells
- Structure and function of eucaryotic cells
- Necessity and effects of microbial nutrition
- Microbial growth relations and possible limitations
- Microbial metabolism: Energy production, conservation and release
- Microbial metabolism: Enzymes syntheses and regulation.

Lecture: Technical and medical microbiology for engineers

- Important (sewage) water based /water related diseases/ detection and possible countermeasures
- Important soil and air connected diseases
- (micro)biological principles in application of engineering techniques
- Implication of engineer work on ecosystems /environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

13. Inhalt:	<p>Hydrological Modeling:</p> <p>What happens to the rain? This is the basic question that needs to be addressed in order to predict the amount of discharge at</p>		

a certain location in a river system at a given time. Which parts of the fate of rainfall can be determined on a physical basis, and which are still left to empirical searching? Beside the qualitative determination of e.g. the processes of evapotranspiration, infiltration, interflow etc. we also need to describe the quantities of these processes to be able to forecast e.g. flood events. Hydrological watershed modelling is fundamental to integrated water management. There are complex interactions between the elements of the environmental continuum. In order to predict future behaviour and to quantify effects of management changes, quantitative mathematical descriptions are needed. A number of advanced hydrological watershed models have been developed in the last 30 years. A few of them will be reviewed in terms of their data needs and their predictive power. The participants are encouraged to form groups and to use their selected models for the same catchment so that the different approaches are compared.

Integrated model systems for the groundwater management:

Water is unique – no other element is so ubiquitous, vital, vulnerable and threatening at the same time. We must secure our access to clean water, shield our civilization from droughts and floods, use water sustainably in food and energy production, and protect water as part of our environment. However our surroundings behave non-trivially in various time and spatial scales. Moreover, many environmental systems such as hydrological systems (precipitation, evaporation, infiltration, groundwater flow, surface flow, etc.) are heterogeneous, non-linear and dominated by real-time influences of external driving forces. Unfortunately, a complete picture of surroundings water systems is not available, because many of these systems cannot be observed directly and only can be derived using sparse measurements. Modeling plays a very important role in reconstructing (as far as possible) the complete and complex picture of the surroundings water systems and offers a unique way to predict behavior of such multifaceted systems. The current course deals with Integrated Watershed Modelling. The main modelling principles are discussed that helps adequately describe the natural system and its behavior on the basis of the corresponding physical processes. It's imply assumptions about physical concepts, numerical schemes, mathematical formulations, boundary conditions and modelling parameters. The course offers concepts how to incorporate the data into the modelling process, how to calibrate the established model and how to perform validate against the available observation data. The course introduces theoretical concepts and demonstrates how to transfer them into practical applications using hydrological and groundwater modelling. This course is offering insights into the MODFLOW Software that is the USGS's modular hydrologic model. MODFLOW is considered an international standard for simulating and predicting groundwater conditions and groundwater/surface-water interactions. Additionally course is exploring some features of MATLAB software as one of most productive software environment for engineers and scientists.

11. Empfohlene Voraussetzungen:	<p>Recommended background knowledge: Basic knowledge of statistics</p> <p>Prerequisite module: none</p>		
12. Lernziele:	<p>Concepts of Geostatistics: Knowledge of the basic geostatistical concepts, difference between Kriging and simulation, advantages and disadvantages of the discussed methods, application of Kriging and simulation</p> <p>Stochastic Modeling: The participants have skills in basic statistical methods used in hydrology, like time series analysis, extreme value statistics, parameter estimation methods and statistical tests.</p>		
13. Inhalt:	<p>Concepts of Geostatistics: Geostatistical procedures for the interpolation of measured values, assessment of model parameters and planning of Measuring networks are dealt with.</p> <p>Contents:</p> <ul style="list-style-type: none"> • Introduction • Statistical hypotheses: Basic concepts, Regionalized variables, Second order stationarity, Intrinsic hypothesis, Comparison of the two hypotheses, Selection of the regionalized variable 		

- The variogram: The experimental variogram, The theoretical variogram, Variogram models, Variogram fitting, Isotropy -, anisotropy
- Ordinary Kriging: Point kriging, Block kriging, Properties of ordinary kr., Kr.as an interpolator, Kr. and the variogram, Practice of kr., Selection of the neighbourhood, Kr. with a "false" variogram, Cross validation, Kr. with uncertain data, Simple Kr.
- Non stationary methods: Universal kr., Intrinsic random functions of order k, External-Drift-Kr.
- Indicator Kriging: Indicator Kriging, Applications
- Kriging with arbitrary additional information: Markov-Bayes-Kriging, Simple Updating (SU)
- Time dependent variables
- Simulations: Basic definitions, Monte Carlo, Turning Band, Unconditional simulation, Conditional simulation, Sequential Simulation, Simulation using Markov Chains, The Hastings Algorithm, Simulated annealing, Indicator Simulation, Truncated-Gaussian Simulation, Application of simulations
- Exercises

Stochastic Modeling:

The lecture part stochastic modeling is primarily concerned with the stochastic analysis of temporal and areal arrays, their generation and their use in the hydrological modeling. Calculation and analysis of hydrological data, descriptive statistic and their parameters, possibility analysis, correlation and regression, time series analysis and simulation.

Content:

- Univariate Statistics and multivariate Statistics (e.g. regression analysis)
- theory of probabilities
- random variables and probability functions (e.g. Poission distribution)
- estimation of parameters (e.g. Maximum Likelihood Method)
- statistical tests (e.g. Kolmogorov-Smirnov test)
- extreme value statistics (analysis of the frequency of occurrence of floods)
- time series analysis (e.g.. ARMA Models)
- stochastic simulations (Monte-Carlo Methods)

11. Empfohlene Voraussetzungen:

12. Lernziele:

Teil „Data and Statistics“:

Die Studierenden können Umweltdaten für den Import aufbereiten und z.B. mit Excel visualisieren, analysieren und ihre Qualität bewerten. Sie sollen zielorientiert Methoden aus der deskriptiven Statistik und der Regressionsanalyse auswählen und anwenden können. Sie sollen den Nutzen von Wahrscheinlichkeitsrechnung, Zufallsvariablen und Zufallssimulation bewerten können und die grundlegenden Methoden auf einfache Beispiele anwenden können.

Teil „Optimierung“:

Die Studierenden sollen Optimierungsprobleme klassifizieren und geeignete Optimierungsalgorithmen kennen und auswählen können. Darauf aufbauend sollen angewandte Optimierungsprobleme und Modellkalibrierungsprobleme formuliert und in EXCEL oder MATLAB gelöst werden. Abschließend sollen sie den Unterschied zwischen Kalibrierung und bedingter Zufallssimulation am Beispiel von einfachen Anwendungsproblemen erklären können.

13. Inhalt:	Teil „Data and Statistics“: • Preprocessing, Visualisierung und Analyse von Daten • Uni- und bivariate deskriptive Statistik • Lineare Regression • Grundlagen der Wahrscheinlichkeitsrechnung • Ausgewählte Verteilungen • Zufallssimulation Teil “Optimization”: • Definition und Klassifizierung von Optimierungsproblemen • No-Free-Lunch Theorem • Einführung von Optimierungsalgorithmen mit Anwendungsbeispielen o Simplex o Steepest Descent, Newton, Levenberg-Marquardt o Heuristiken: Evolutionäre Algorithmen, Simulated Annealing o Modellkalibrierung als Optimierungsproblem und als bedingte Zufallssimulation

100380

2. Modulkürzel:	-	5. Moduldauer:	Einsemestrig
3. Leistungspunkte:	6 LP	6. Turnus:	Wintersemester
4. SWS:	-	7. Sprache:	Englisch

8. Modulverantwortlicher: PD Dr.-Ing. Claus Haslauer

9. Dozenten:

10. Zuordnung zum Curriculum in diesem Studiengang: M.Sc. Water Resources Engineering and Management, PO 913-2017,
 → Spezialisierungsmodule
 M.Sc. Water Resources Engineering and Management, PO 913-2012,
 → Spezialisierungsmodule

11. Empfohlene Voraussetzungen:

- fundamentals of groundwater flow as well as solute and heat transport
- balance equations (mass, energy, momentum): control volume, mass flux/loading, reactions, sources &; sinks.
- fundamentals of chemistry: redox reactions, solubility, chemical precipitation, sorption, chemical equilibria, reaction-kinetics

12. Lernziele:

Upon the completion of this course, the students will be adept at understanding and interpreting existing remediation systems.

- This includes:
- understanding the complex physical-chemical processes upon which successful groundwater and soil remediation schemes are based;
 - being able to describe various types of contaminants and their behavior in a variety of hydrogeological settings;
 - assessing critical factors (e.g., chemical or physical characteristics of the source, site conditions) related to remediation design and how they can be represented in a conceptual site model;
 - understanding the following processes and being able to judge the effects of a set of parameter values on a remediation design:
 - o physical processes (e.g., interfacial tension, density, viscosity);
 - o chemical and biological processes (e.g., reduction, oxidation, retention, reactions);
 - knowing existing tools of innovative site characterization methods and in-situ remediation technologies, including possibilities for their use and their limitations;
 - being able to interpret observation data in conjunction with model results, and critically evaluation of designs and/or model results subject to (often significant) uncertainty;

13. Inhalt: The behavior and remediation of contaminants in natural environment systems

(i.e., soil, water, and air) relies on an interplay of contaminant transport processes.

For example:

- Will a historical, current, or future contaminant release pose a threat to humans and ecosystems?
- What is the risk of this impact?
- How long will it take for a beneficial management practice to mitigate contamination?
- Are the environmental data collected consistent with a known source?
- What are the impacts of engineered interventions?
- What is the limiting process for treatment?
- Will climate change affect a long-term groundwater remediation project?

The objective of this course is to introduce you to practical aspects of mass and heat transport processes in natural environmental systems. Given the specifics of a contaminated site you will be able to assess what treatment system could lead to a successful remediation in regulatory and monetary terms, and which treatment systems might be less useful.

The overall content of this course are physical, chemical, and biological processes related to contaminant transport and to remedial design. The course has three components:

1. groundwater and soil remediation (lecture);
2. remediation technologies (seminar) in which students present and discuss relevant remediation technologies;
3. case studies of remediation design (seminar) in which guest lecturers present case studies that are being critically evaluated by the students;

The economical aspects of remediation design are being discussed by including partners from industry in guest lectures as well as by site visits.

12. Lernziele:

River Engineering and Sediment Management

The students,

- are aware of rivers must be regarded and managed based on an integrated approach
- know the basic concept of the European Water Framework Directive (WFD) and the German legal framework for river basin management
- are able to analyze and estimate the consequences of the WFD based inventory for future management
- are aware of sediment transport processes and of the complexity of the interactions and relations
- recognize the possibilities and limitations of sediment managements strategies

Integrated Flood Protection Measures

The students,

- are aware of the fact that flood protection is an integral process, based on different components (e.g. technical flood protection measures, prevention)
- know the basic physical processes: dynamics of flood events, calculation of discharges and water depths, flood wave propagation, functionality of retention and protection structures: reservoirs, dams and dikes
- know 1-D and 2-D numerical hydro-dynamic models
- are able to apply their knowledge on practical engineering problems related to flood protection

13. Inhalt:	<p>The module consists of two lectures:</p> <p>River Engineering and Sediment Management</p> <ul style="list-style-type: none"> • Basic approaches of river basin management (legal framework) • Systematics and results of basic inventory due to the WFD • Anthropogenic impacts on river basins • Origin of sediments and fundamental principles of transport • Sediment management measures on different scales <p>Integrated Flood Protection Measures</p> <ul style="list-style-type: none"> • Socio-economic aspects of flood damage • Calculation of water depths • Hydro-dynamic flood wave calculation, Saint Venant-equation • Technical flood protection measures • Design and operation of retention basins • Set-up of damage and risk maps, design of overtopping earthen dams and dikes • Probability of failure, reliability calculation, flood risk management

11. Empfohlene Voraussetzungen:	None		

12. Lernziele:

Power Demand, Supply and Distribution:

The students,

- know the German, European and worldwide energy markets related to demand, supply and its distribution capabilities
- are aware of that non-renewable energy sources are strictly limited and time-scales for conversion of energy markets long
- have an idea about the relations between energy, politics, social changes and influences on environment
- have a basic knowledge about present energy conversion systems, theoretical limits of efficiencies, and the potential to enhance applied technology
- have a basic understanding about where and how energy is provided and distributed
- comprehend the balance between load and supply in electrical grids and the resulting necessity for control energy.

Water Demand, Supply and Distribution:

The students,

- know the German and worldwide water systems related to demand, supply and its distribution capabilities
- have an overview on the water supply situation all over the world.
- recognize the different possibilities and levels of water supply
- have an idea of the relations between water, politics, social changes and influences on environment.

13. Inhalt:

Power Demand, Supply and Distribution:

- Energy demand, energy supply
- Energy generation
 - overview of different types of power plants
 - renewable energy
 - thermal power plants (conventional and nuclear)
- Areas of application of different power plants
- Emission control techniques
- Cooling of thermal power plants
 - methods
 - water resources aspects
- Energy transport and energy storage
- Net techniques
- Energy market
 - trade
 - politics
 - law
- social changes due to energy supply

Water Demand, Supply and Distribution:

- Water supply and water distribution: necessity, basic requirements, elements, hydrological cycle
- Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods
- Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas
- Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems.
- Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters
- Water storage: necessity, types and functions of tanks and reservoirs
- Case study: planning and design of a water supply system for a small town

11. Empfohlene Voraussetzungen:

12. Lernziele:

Lecture: Inorganic chemistry

The students

- know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
- know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
- know about the most important industrial compounds, their preparation and environmental aspects in their application.

Lecture: Organic chemistry

The students

- can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the common rules for their nomenclature
- know the most important representatives thereof and are able to draw their structural formulae
- know the structure and properties of important bio-molecules such as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic acids
- know the most important reactions involved in chemical and microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general function with respect to cell structures, enzymatic and immune reactions
- knows selected environmental organic contaminants (PAH, dioxins, pesticides etc.) and their properties

Lecture: Biology and ecology of water, soil and air systems

The students

- know about the relation between water, soil and air compartments and many diseases, happening especially in developing countries
- know about the reasons for break out of diseases, the structure and function of prokaryotic and eucaryotic cells as well as the methods for identification and determination of growth conditions and possible growth limitations
- comprehend microbial metabolism, energy production, release and conservation, enzyme syntheses and their regulation.

- know important events and scientists in the history of biology
- know basics in ecology of natural and artificial ('technical') ecosystems as well as selected methods to detect distorted equilibria in technical ecosystems influenced by mankind

Lecture: Technical and medical microbiology for engineers

The students

- know the most important microorganisms being active in plants treating waste water, air and contaminated soil
- know the kind of participation in purification and thus the procedures used to make them feel happy as well as the problems associated with excess biomass
- are aware of a detailed overview of the kind of medically important microorganisms and of the most relevant agents of illness met in these plants, this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

Lecture: Inorganic chemistry

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms
- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
- chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
- quantitative Relationships and Stoichiometric Equations
- characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
- descriptive part: selected chemical compounds and their preparation and properties

Lecture: Organic chemistry

- functional groups and compound classes
- classification of chemical reactions in organic chemistry
- organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
- chemical and microbial degradation of organic matter in the environment
- summary parameters
- organic environmental contaminants

Lecture: Biology and ecology of water, soil and air systems

The following topics are presented within the lecture:

- Introduction in history of microbiology

- Important waterbased/water related diseases
- Function of microscopy of staining techniques
- Structure and function of prokaryotic cells
- Structure and function of eucaryotic cells
- Necessity and effects of microbial nutrition
- Microbial growth relations and possible limitations
- Microbial metabolism: Energy production, conservation and release
- Microbial metabolism: Enzymes syntheses and regulation.

Lecture: Technical and medical microbiology for engineers

- Important (sewage) water based /water related diseases/ detection and possible countermeasures
- Important soil and air connected diseases
- (micro)biological principles in application of engineering techniques
- Implication of engineer work on ecosystems /environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

11. Empfohlene Voraussetzungen:	Prerequisite Modules : Sanitary Engineering Urban drainage and design of Wastewater treatment plants Chemistry and Biology for Environmental Engineers		
12. Lernziele:	<p>The student knows and understands in theory and practice</p> <ul style="list-style-type: none"> - the most important parameters to characterize water and waste water and the analytical methods to determine them (e.g. pH, nitrate, ammonium, phosphorus, alkalinity, acidity, permanganate index, conductivity, oxygen, loss of ignition, filterable matter). - important techniques for removal of water contaminants (e.g. ion exchange, precipitation, coagulation, sorption, neutralization, aerobic, anoxic and anaerobic degradation) - how to take representative samples out of the different waste streams and the relevant sampling errors <p>The student is aware of the most important microbiological tools to detect, handle and use microorganisms in environmental engineering systems</p> <p>The student</p> <ul style="list-style-type: none"> - is capable of interpreting and evaluating analytical data and based on these data to draw conclusions in order to evaluate the quality of water and the efficiency of processes for treatment of water and solid waste. - is able to apply the relevant laboratory test procedures to analyze compost within the quality assurance system and to interpret the results. - has the competence to develop a sampling procedure for household waste and to determine the waste composition by a sorting analyses - is able to apply selected test procedures in the field of hazardous waste and the analyses of odor samples 		
13. Inhalt:	This course serves to the intensification of the theoretical knowledge in sanitary engineering by practical work in the laboratory and an accompanying student seminar. The experiments offered belong thematically to the three main areas:		

- water and waste water
- solid waste
- chemistry and microbiology

The experiments are mainly performed directly by the students in groups of 3 to max. 6 or offered as demonstration experiments.

11. Empfohlene Voraussetzungen:	Biologie Grundkenntnisse / basic knowledge in biology		
12. Lernziele:	<p>Knowledge on Limnology, Hydrobiology and Limnic Ecology is essential for solving problems concerned with water protection.</p> <p>Lecture Limnic Ecology The student knows about abiotic factors (e.g. light, nutrients, flow regime) to impact biocoenosis and thus to structure habitats/ biotopes. He/She understands the organisms and their metabolic activities in detail, ranging from primary producers (microalgae, macrophytes) to secondary producers and consumers up to trophic relationships (from microbial loop to higher food webs). The student is familiar with challenges for health and safety of water bodies / drinking water as well as self-purification within aquatic systems with regard to eutrophication, human impacts in a wider sense as well as natural toxic algae blooms. The student knows about the important question on the ecological balance of water bodies and strategies of biomanipulation, decontamination up to restoration in order to support the natural regeneration potential of aquatic systems. He/She understands both habitats, water column and sediment, as both compartments are strongly linked to each other and determine the overall health status.</p> <p>Seminar Selected topics in Limnic Ecology The student knows how to present research to an audience by practising and improving important presentation skills (soft skills) in response to appropriate feedback. At the same time he/she deepened his/her knowledge in selected topics by choosing a topic of his/her special interest from Limnic Ecology. The students learned about external lecturer and their special fields of interest and how to participate in a lively discussion.</p>		
13. Inhalt:	Lecture "Limnic Ecology"		

This lecture gives insights into morphology and ecological principles of different water bodies (natural / artificial, groundwater, streams, lakes, drinking reservoirs etc).

- Basic definitions and classifications schemes for a range of aquatic habitats, differences in lotic and stagnant water bodies
- Abiotic factors and their impact on organisms and habitat: light, temperature, flow regime/turbulence, wind, water level, chemical factors, pH, conductivity, oxygen and nutrients
- Biotic factors such as competition, prey-predator relations, biological engineering as well as primary and secondary production and decomposition
- Ecosystem functions such as nutrient recycling, food webs or engineering / sediment stabilisation
- Challenges for health and safety of water bodies: natural (toxic algae) to human (eutrophication) impacts
- Strategies to re-establish or support ecological balance, is there an ecological balance?
- Important methods investigating single abiotic (e.g. oxygen, nutrients) and biotic (e.g. chlorophyll) factors as well as complex interactions on ecological level (e.g. community composition) with implications for water purity will be presented

Seminar Selected topics in Limnic Ecology

A range of possible topics (front of research or actual/political interest) will serve as a choice, but also the students can come up with own ideas

13. Inhalt:	<p>Hydrological Modeling:</p> <p>What happens to the rain? This is the basic question that needs to be addressed in order to predict the amount of discharge at</p>		

a certain location in a river system at a given time. Which parts of the fate of rainfall can be determined on a physical basis, and which are still left to empirical searching? Beside the qualitative determination of e.g. the processes of evapotranspiration, infiltration, interflow etc. we also need to describe the quantities of these processes to be able to forecast e.g. flood events. Hydrological watershed modelling is fundamental to integrated water management. There are complex interactions between the elements of the environmental continuum. In order to predict future behaviour and to quantify effects of management changes, quantitative mathematical descriptions are needed. A number of advanced hydrological watershed models have been developed in the last 30 years. A few of them will be reviewed in terms of their data needs and their predictive power. The participants are encouraged to form groups and to use their selected models for the same catchment so that the different approaches are compared.

Integrated model systems for the groundwater management:

Water is unique – no other element is so ubiquitous, vital, vulnerable and threatening at the same time. We must secure our access to clean water, shield our civilization from droughts and floods, use water sustainably in food and energy production, and protect water as part of our environment. However our surroundings behave non-trivially in various time and spatial scales. Moreover, many environmental systems such as hydrological systems (precipitation, evaporation, infiltration, groundwater flow, surface flow, etc.) are heterogeneous, non-linear and dominated by real-time influences of external driving forces. Unfortunately, a complete picture of surroundings water systems is not available, because many of these systems cannot be observed directly and only can be derived using sparse measurements. Modeling plays a very important role in reconstructing (as far as possible) the complete and complex picture of the surroundings water systems and offers a unique way to predict behavior of such multifaceted systems. The current course deals with Integrated Watershed Modelling. The main modelling principles are discussed that helps adequately describe the natural system and its behavior on the basis of the corresponding physical processes. It's imply assumptions about physical concepts, numerical schemes, mathematical formulations, boundary conditions and modelling parameters. The course offers concepts how to incorporate the data into the modelling process, how to calibrate the established model and how to perform validate against the available observation data. The course introduces theoretical concepts and demonstrates how to transfer them into practical applications using hydrological and groundwater modelling. This course is offering insights into the MODFLOW Software that is the USGS's modular hydrologic model. MODFLOW is considered an international standard for simulating and predicting groundwater conditions and groundwater/surface-water interactions. Additionally course is exploring some features of MATLAB software as one of most productive software environment for engineers and scientists.

Stochastic Modeling:

The lecture part stochastic modeling is primarily concerned with the stochastic analysis of temporal and areal arrays, their generation and their use in the hydrological modeling. Calculation and analysis of hydrological data, descriptive statistic and their parameters, possibility analysis, correlation and regression, time series analysis and simulation.

Content:

- Univariate Statistics and multivariate Statistics (e.g. regression analysis)
- theory of probabilities
- random variables and probability functions (e.g. Poission distribution)
- estimation of parameters (e.g. Maximum Likelihood Method)
- statistical tests (e.g. Kolmogorov-Smirnov test)
- extreme value statistics (analysis of the frequency of occurrence of floods)
- time series analysis (e.g.. ARMA Models)
- stochastic simulations (Monte-Carlo Methods)

11. Empfohlene Voraussetzungen:	<p>Recommended background knowledge: Geoengineering: Basic knowledge of mechanics and groundwater flow Geohydrology: Basic knowledge of groundwater hydraulics Prerequisite module: none</p>		
12. Lernziele:	<p>Geoengineering: The students have the required skills to treat fundamental soil mechanics problems such as: groundwater flow, consolidation, slope stability, settlement and soil strength calculations.</p> <p>Geohydrology: The students have a strong foundation in the applied skills required to locate, analyse, assess, develop, and protect groundwater resources.</p>		
13. Inhalt:	<p>Geoengineering: This course includes information about the origin of soils and soil classification methods. It also includes the basics of groundwater flow as used in soil mechanics. Common geotechnical problems such as slope stability and soil consolidation are discussed and clarified. The stresses in soil, stiffness of soils and strength of soils are explained in details.</p> <p>Geohydrology: Covers the most important concepts of geology and hydrogeology, the interpretation of hydrogeological information from maps, aerial</p>		

photographs, geophysical measurements and field data, the principles of groundwater development and the understanding of hydrogeological systems through case studies. A brief overview is given on the analysis of hydrochemical data and isotopes.

9. Dozenten: Kristina Terheiden
Jochen Seidel

10. Zuordnung zum Curriculum in diesem Studiengang:

M.Sc. Water Resources Engineering and Management , PO 913Mal2018,
→ Elective Modules
M.Sc. Water Resources Engineering and Management, PO 913-2012, 3. Semester
→ Spezialisierungsmodule
M.Sc. Water Resources Engineering and Management, PO 913-2017, 3. Semester
→ Spezialisierungsmodule
M.Sc. Water Resources Engineering and Management, PO 913ChI2018, 3. Semester
→ Semi-Compulsory Modules

11. Empfohlene Voraussetzungen:

12. Lernziele:

Students know about crop water demand and supply, conservation of soil quality and, in this context, about decision making as well as planning and design processes.

Irrigation Issues (Terheiden):
Students have theoretical and practical back ground knowledge of irrigation and soil conservation issues.

Computer Applications in Water Engineering (Terheiden):
Students know how to apply computer programs related to irrigation- and river basin-management.

Multi Objective Decision Making in Water Resources Management (Seidel): Students are able to apply various decision making methods and are able to use them for the appraisal of large projects such as irrigation schemes and/or river training works

13. Inhalt:

Water Management and Irrigation Facilities:

- Water demand, scarcity and availability
- Assessment of crop water demand
- Irrigation facilities
- Health hazards of irrigation facilities
- Soil erosion and salinization

Computer Applications in Water Engineering:
Theory and application of computer programs such as

- SimResSedim: Water and sediment balance of reservoirs
- Sahel: Interaction between socio-economic human activities and water- and land-resources of the used area

- Wasim: Water and salt balance in soils
- Wepp: Water Erosion of crop- and natural land
- Cropwat: Crop water requirements and irrigation scheduling
- Hec-Ras, Mike11, Hydro_As 2D: One- and two-dimensional hydrodynamic modeling of river systems

Multi Objective Decision Making in Water Resources Management:

The use of evaluation and decision making methods in order to determine long term effects on planed actions will be addressed. Registration, quantification and evaluation of project alternatives using different methods and techniques are focused:

- Cost comparison method
- Linear Programming
- Multi Objective Decision Making methods, e.g. Composite Programming, ELECTRE, MCQA
- Case study using Composite Programming
- Introduction to Game Theory and Conflict Analysis

11. Empfohlene Voraussetzungen:	Basic notions of infrastructure planning		
12. Lernziele:	<p>The students understand techniques for dealing with complex decision situations and gain insights in the decision-analysis process for both public and private decision-making with all related steps. Social aspects that may influence planning process or outcome will also be discussed. The students are acquainted with fundamental notions of demography as far as urban and regional planning is concerned. The students are able to apply basic methods of demographic analysis and forecasting.</p>		
13. Inhalt:	<p>The module consists of two courses: The lecture "Decision Analysis" will cover the following subjects:</p> <ul style="list-style-type: none"> • Elements of Decision Problems • Structuring Decisions • Generating Objectives and Hierarchies • Generating Alternatives • Decision Making with Multiple Objectives • Risk and Uncertainty in Decision Situations • Collective Decision Making • Application to Infrastructure Planning <p>The course Demographic Analysis and Forecasting will provide an overview of the most frequently appearing issues of demographic analysis and forecasting. It will consist of three main parts: Fundamental notions of (applied) demography and some of the methodical/conceptual problems linked with these notions. Selected fundamental approaches to analysing and forecasting natural growth (or decline) of population, will be presented and discussed critically. Examples of such analyses and forecasts will be calculated. Migration, as the most critical and most important aspect of population development under regional aspects, will constitute the main topic of the third part. Basic methods of analysing and forecasting migration will be presented and discussed with regard to their application on concrete cases.</p>

11. Empfohlene Voraussetzungen:			
12. Lernziele:	<p>Students will know how river ecosystems are functioning. Understanding natural processes is the basis for the assessment of changes in riverine ecosystems and for the development of mitigation measures. They get the basic knowledge about macrozoobenthos and fish fauna, with a focus on the species used in the CASiMiR model. Students will also get familiar with legislation on European level (WFD) and it's national implementation.</p> <p>They can analyse ecological impacts of hydropower driven changes in river systems. They know about the approaches to link requirements of water organisms with hydraulics. They have the skills to translate sampling data into habitat requirement data needed for habitat simulations. They are able to use modeling tools to quantify modifications in the amount and quality of riverine habitats. They are able to do basic assessments of these modifications.</p>		
13. Inhalt:	<p>River ecosystems</p> <ul style="list-style-type: none"> - Introduction to limnology - Large Rivers: Volga und Danube - Macrozoobenthos: Biology, demands of indicator species - Fish: Biology, migration - Legislation: European WFD, implementation and targets <p>Hydropower: Environmental Impacts and mitigation</p> <ul style="list-style-type: none"> - Types of HPPs - Ecological flow - "Fish ladders" - Approaches for the description of habitats - Fuzzy-rule based modelling - Minimum flow and methods for assessment - Attraction flow and hydraulic investigation of migration facilities <p>Ecohydraulic Investigations</p> <ul style="list-style-type: none"> - Ecohydraulics and environmental hydraulics - Linkages between structural, hydraulic, and biological parameters 		

- Hydronumeric modelling in low and average flow situations
 - Approaches for the description of habitats
 - Fuzzy-rule based modelling
 - Minimum flow and methods for assessment
 - Attraction flow and hydraulic investigation of migration facilities
 - Morphological enhancements and model based assessment
-

11. Empfohlene Voraussetzungen:	Chemistry and Biology for Engineers Sanitary Engineering		
12. Lernziele:	<p>The goal of this course is to provide advanced knowledge of the processes and concepts of constructed wetlands systems to the students. They will get familiar with the existing scientific, technical, and economic practices of using constructed wetlands for wastewater and sewage sludge treatment. For this reason all late scientific developments concerning municipal industrial and agro-industrial wastewater treatment and sewage sludge treatment will be presented, At the end of the course the students will be able to:</p> <ul style="list-style-type: none"> • Understanding constructed wetlands' main mechanisms. • Perform a rough design of constructed wetlands treating various waste waters and sewage sludge 		
13. Inhalt:	<p>Basic principles of constructed wetlands</p> <ul style="list-style-type: none"> • Attached growth treatment systems • Constructed wetlands (basic principles, types, vegetation, porous media, etc) • Pollutant removal mechanisms and kinetics (organic matter, nitrogen, phosphorus, heavy metals, suspended solids) • Sewage sludge treatment (de-watering mechanisms, mineralisation processes) <p>Design of constructed wetlands</p>		

- Constructed wetlands' design models (hydrodynamic and pollutant removal models)
- Determination of required constructed wetland area
- Sewage sludge treatment (sludge loading rates, duration of loading and resting periods)

Case studies

- Municipal wastewater treatment
- Agro-industrial wastewater treatment

Sewage sludge treatment

20. Angeboten von:	II/3 Interkultureller Unterricht		

Modul: 80990 Master's Thesis WAREM

2. Modulkürzel:	-	5. Moduldauer:	Einsemestrig
3. Leistungspunkte:	30 LP	6. Turnus:	Wintersemester/ Sommersemester
4. SWS:	20	7. Sprache:	Englisch
8. Modulverantwortlicher:	Univ.-Prof. Dr.-Ing. Silke Wieprecht		
9. Dozenten:	Depending on the topic. The first examiner has to be a full professor of the University of Stuttgart or a member of the senior academic staff who is an authorized examiner according to the legal statutes.		
10. Zuordnung zum Curriculum in diesem Studiengang:	M.Sc. Water Resources Engineering and Management , PO 913Mal2018, M.Sc. Water Resources Engineering and Management, PO 913-2017, M.Sc. Water Resources Engineering and Management, PO 913-2012, M.Sc. Water Resources Engineering and Management Mara Incoming Double Degree, PO 913Mal2012, M.Sc. Water Resources Engineering and Management, PO 913ChI2018, M.Sc. Water Resources Engineering and Management Chalmers Incoming Double Degree, PO 913ChI2012,		
11. Empfohlene Voraussetzungen:	The topic of the Master Thesis can be handed out only the moment at least 72 ECTS have been acquired already by the candidate.		
12. Lernziele:	<p>Capability to implement an independently composed project schedule for the treatment of a recent scientific problem in an international research environment.</p> <p>Effective scientific work in a team, enforcement of strategies internally and particularly externally. Acquire the necessary stamina to not be discouraged by unexpected problems and throwbacks in scientific projects and to finally be successful by the formulation of alternative methods of resolution.</p> <p>Multidisciplinarity through contacts with representatives of other fields like Chemistry, Mathematics, Informatics, etc.</p> <p>Obtaining the capability to discuss the own results of research in the environment of the recent international research comprehensively and to represent them in written (Master's Thesis) and oral (talk) form.</p>		
13. Inhalt:	<p>Treatment of a recent scientific problem in an international research environment.</p> <p>The successful treatment of the scientific problem requires the specialisation in the related field of research and the acquisition of the necessary knowledge.</p>		
14. Literatur:	Recent literature on the topic of the scientific problem		
15. Lehrveranstaltungen und -formen:			
16. Abschätzung Arbeitsaufwand:	900 h (Contact time: 900 h)		
17. Prüfungsnummer/n und -name:	80991 Master's Thesis WAREM (PL), , Gewichtung: 1
